

RGD-009 - Constitutional Dependency Register

I think this is the missing governance artifact.

The **OriginOS Lexicon Register (OXL)** tells us *what* every concept means.

The **OriginOS Constitutional Dependency Register (OCDR)** tells us *why* that concept exists, *what it depends on*, *what depends on it*, and *what constitutional consequences follow if it changes*.

Without the OCDR, future amendments can unintentionally invalidate large parts of the corpus.

OriginOS Constitutional Dependency Register (OCDR)

Constitutional Status: Governing Register

Authority: Constitution

Maintained By: Constitutional Reconciliation Programme (CRP)

Purpose

The OCDR is the authoritative record of constitutional dependencies within the OriginOS Discovery Programme.

Unlike recovery order, the OCDR records the actual logical, mathematical, ontological, epistemic, computational, normative, and transformational dependencies among recovered concepts.

Its purpose is to ensure that:

- amendments remain scientifically safe;
 - hidden dependencies are exposed;
 - circular reasoning is detected;
 - recovery order is not confused with logical necessity;
 - future discoveries cannot silently invalidate earlier canon.
-

Governing Principle

Recovery order is **not** dependency.

For example:

Reality

↓

Sprint 0

↓

Sprint I

↓

Sprint II

↓

Sprint III

↓

Sprint IV

↓

Sprint V

does **not** imply every Sprint IV discovery depends upon every Sprint III discovery.

The OCDR records only dependencies that survive constitutional scrutiny.

Dependency Types

Every dependency shall be explicitly typed.

No untyped arrows are permitted.

D1 — Ontological Dependency

Meaning

A thing cannot exist without another thing existing.

Example

Commitment

depends on

Participant

because commitments cannot exist without participants.

Notation

ONT →

D2 — Constitutive Dependency

Meaning

A concept is defined partly in terms of another concept.

Removing the dependency changes the definition.

Notation

CON →

D3 — Mathematical Dependency

Meaning

The mathematical recovery requires another mathematical structure.

Notation

MATH →

D4 — Computational Dependency

Meaning

A computation cannot lawfully occur without another recovered structure.

Notation

COMP →

Example

Purpose Fulfillment Evaluation

depends upon

Purpose.

D5 — Epistemic Dependency

Meaning

Knowledge of one phenomenon depends upon another.

Reality itself does not.

Notation

EPI →

Example

Capability estimation

depends upon

Enterprise Knowledge.

Capability itself does not.

D6 — Causal Dependency

Meaning

One phenomenon can bring about another.

Notation

CAUSE →

This must not be confused with logical dependency.

D7 — Normative Dependency

Meaning

A concept derives legal or institutional standing from another.

Notation

NORM →

D8 — Temporal Dependency

Meaning

One phenomenon must precede another.

Notation

TIME →

Temporal order alone never establishes causation.

D9 — Recovery Dependency

Meaning

The concept could not be scientifically recovered until another had first been recovered.

Notation

REC →

This documents discovery order only.

D10 — Amendment Dependency

Meaning

If Concept A changes, Concept B requires constitutional review.

Notation

AMD →

This is perhaps the most important dependency for CRP.

Register Structure

Every constitutional concept receives one record.

OCDR-ID

Example

OCDR-00041

Permanent.

Never reused.

Canonical Term

Example

Capability

Classification

Primitive

Derived Structure

Relation

Law

Theorem

Evaluation

Quantity

Status

Candidate

First Recovery

Sprint

Section

Finding

Current Status

Ratified

Candidate

Superseded

Rejected

Amended

Frozen

Dependency Table

Every dependency is listed individually.

Example

Dependency Type	Depends On	Why
ONT	Participant	Capability requires Participants capable of realizing transformations
MATH	Transformation	Capability is transformation-relative
CON	Means	Capability is partly constituted by Means
CON	State	Capability is State-relative
CON	Context	Capability evaluation is Context-relative
AMD	Means	Future changes to Means require Capability review

Reverse Dependency Table

The register must also answer:

Who depends on me?

Example

Capability influences:

- Sufficiency Evaluation
- Feasibility
- Transformation Planning
- Enterprise State
- Viability
- Mobilization (candidate)

This prevents hidden breakage.

Circular Dependency Check

Every record contains:

Circular dependency?

Yes / No

Explanation

Circular recovery is constitutionally prohibited unless mathematically proven.

Primitive Independence Audit

Each record contains

Could this dependency be eliminated?

Yes

No

Unknown

Reasoning

This supports future simplification.

Amendment Impact

Every constitutional amendment updates this table.

Example

AM-008

Changed:

Capability

Automatically flags:

- Sufficiency Evaluation
- Enterprise State
- Viability
- Transformation Planning

for review.

Cross-Sprint Dependency Matrix

A matrix summarizes dependencies across the programme.

Concept	S0	SI	SII	SIII	SIV	SV
Purpose	•	•	•	•	•	•

Means	•	•	•	•
Capability		•	•	•
Enterprise Computati on		•	•	•
Causal Structure				Candidate

This shows where concepts participate without implying origin.

Hidden Dependency Register

One of the most valuable sections.

Every time CRP discovers:

"Changing X unexpectedly affects Y"

a hidden dependency is recorded.

Example

HD-014

Capability

↓

Enterprise State

Reason

Capability definition implicitly assumed State-relative integration although this dependency had never been documented.

This becomes evidence for future constitutional refinement.

Dependency Confidence

Every dependency receives an evidence rating.

Verified

Observed repeatedly and constitutionally ratified.

Strong

Supported across multiple Sprints but awaiting formal ratification.

Candidate

Scientifically plausible but not yet admitted.

Rejected

Explicitly falsified.

Unknown

Insufficient evidence.

Constitutional Rules

The OCDR shall enforce the following rules:

1. No concept may be admitted without at least one explicit dependency analysis.
 2. Recovery order shall never be treated as dependency.
 3. Every amendment must update the OCDR before publication.
 4. Every canonical law must identify all dependent concepts.
 5. Every glossary entry in the OriginOS Lexicon Register shall reference its OCDR record.
 6. Circular dependencies must be explicitly justified or eliminated.
 7. Hidden dependencies discovered during reconciliation must be recorded before any manuscript is updated.
 8. Every Sprint Closure Audit shall certify OCDR consistency before a Constitutional Freeze is declared.
-

Relationship to Other Constitutional Registers

The governance system now forms a coherent ecosystem:

Register	Purpose
OriginOS Lexicon Register (OXLR)	Governs the meaning, evolution, and status of every constitutional term.
OriginOS Finding Register (OFR)	Records every scientific finding, its evidence, and constitutional disposition.
OriginOS Constitutional Dependency Register (OCDR)	Governs the dependency graph linking all constitutional concepts, laws, structures, and computations.
OriginOS Amendment Register (OAR)	Records every constitutional amendment and the rationale for change.
OriginOS Definition Gap Register (ODGR)	Tracks undefined, ambiguous, or incomplete concepts requiring future recovery.
OriginOS Supersession Register (OSR)	Preserves the historical evolution of concepts by recording which formulations supersede earlier ones without altering frozen Sprint manuscripts.

I would consider the **OCDR** to be one of the core constitutional governance artifacts. Together with the OXLR and OFR, it gives the Constitutional Reconciliation Programme the information needed to perform dependency-aware reconciliation, detect hidden impacts of amendments, and maintain a stable scientific history while allowing the theory to evolve.
