

RG-012 — OriginOS Constitutional Registers Standard

Version: 1.0

Status: Proposed Constitutional Governance Standard

Authority: OriginOS Constitution

Applies To: All Constitutional Registers maintained by the OriginOS Constitutional Reconciliation Programme (CRP)

1. Purpose

This standard establishes the constitutional framework governing all permanent registers within the OriginOS Discovery Programme.

Constitutional Registers exist to preserve the scientific memory of the programme independently of individual Sprint manuscripts.

They ensure that:

- scientific discoveries remain traceable;
- constitutional history is preserved;
- amendments remain auditable;
- terminology evolves without rewriting history;
- dependencies remain visible;
- unresolved questions are never silently lost.

Registers are **living constitutional artifacts**.

Sprint manuscripts are **historical scientific artifacts**.

These shall never be confused.

2. Governing Principle

Sprint manuscripts preserve the history of discovery. Constitutional Registers preserve the current constitutional state of the programme.

Therefore:

- discoveries belong to Sprints;
 - governance belongs to Governance documents;
 - operational constitutional memory belongs to Registers.
-

3. Scope

This standard governs:

- creation of registers;
- naming;
- identifiers;
- lifecycle;
- authority;
- relationships;
- synchronization;
- change control;
- retirement.

It does not govern:

- discovery methodology;
 - mathematical recovery;
 - implementation repositories;
 - publication formatting.
-

4. Definition

A Constitutional Register is a continuously maintained constitutional record that preserves information requiring ongoing synchronization across the OriginOS corpus.

A register is **not** a manuscript.

A register is **not** a research paper.

A register is a governed constitutional record.

5. Characteristics of a Constitutional Register

Every register shall satisfy the following properties:

- persistent;
 - uniquely identifiable;
 - version controlled;
 - independently auditable;
 - historically traceable;
 - amendment aware;
 - cross-referenced;
 - synchronized with other registers.
-

6. Register Classes

The programme recognizes the following classes.

Class A — Core Constitutional Registers

Required for every constitutional edition.

OXL

OriginOS Lexicon Register

Purpose:

Current constitutional terminology.

OCDR

OriginOS Constitutional Dependency Register

Purpose:

Typed dependency graph.

OFR

OriginOS Finding Register

Purpose:

Scientific findings and determinations.

OAR

OriginOS Amendment Register

Purpose:

Constitutional amendments.

OUQ

OriginOS Unresolved Questions Register

Purpose:

Open scientific questions.

Class B — Scientific Registers

Maintained where applicable.

Examples:

- Primitive Register (OPR)
 - Law Register (OLR)
 - Distinction Register (ODR)
 - Symbol Register (OSR)
 - Mathematical Object Register (OMR)
 - Corpus Register (OCR)
-

Class C — Operational Registers

Maintained by CRP.

Examples:

- Publication Register
 - Audit Register
 - Review Register
 - Certification Register
-

7. Register Naming Convention

Every register shall have:

Short identifier

Example

OXL

Formal name

Example

OriginOS Lexicon Register

Permanent Register ID

Example

OXL-001

Version

Example

v1.3

8. Register Identification

Each register receives:

Register Identifier

OXL-001

Every record inside the register receives its own identifier.

Example

OXL-0042

Register IDs

shall never change.

Record IDs

shall never be reused.

9. Register Lifecycle

Every register progresses through:

Draft

↓

Candidate

Ratified

Operational

Archived (if replaced)

Registers are never deleted.

Superseded registers remain historical records.

10. Register Authority

A register derives authority only from:

- Constitution
- Constitutional Determination
- Ratified Amendment

Registers never create constitutional authority.

They record it.

11. Register Synchronization

Whenever constitutional changes occur, affected registers shall be synchronized.

Example

Changing Capability may require updates to:

- OXL
- OCDR

- OPR
- OLR
- OUQ

Synchronization shall be completed before publication.

12. Cross-Register References

Registers shall reference one another using permanent identifiers.

Example

OXL-0032

↓

OCDR-00117

↓

OFR-000892

↓

AM-014

↓

OUQ-0008

Narrative references shall not replace identifiers.

13. Register Integrity Rules

Registers shall never:

- duplicate authority;
- silently overwrite history;
- remove superseded records;
- delete historical identifiers;

- renumber existing entries.

Historical records remain permanent.

14. Register Versioning

Register versions describe the register itself.

Record versions describe individual entries.

Definition versions describe definitions.

These three version systems shall remain distinct.

15. Register Ownership

Every register shall identify:

Maintaining authority

Responsible programme

Update authority

Certification authority

Publication authority

Ownership shall always be explicit.

16. Mandatory Metadata

Every register shall include:

- title;
- identifier;

- version;
 - authority;
 - purpose;
 - scope;
 - governing rules;
 - change history;
 - maintenance responsibility;
 - certification status.
-

17. Register Audits

Every operational register shall support periodic audits.

Mandatory audit dimensions include:

- completeness;
- provenance;
- identifier integrity;
- synchronization;
- dependency consistency;
- amendment consistency;
- historical preservation.

Audit findings shall themselves be recorded.

18. Register Relationships

The following relationships are normative.

Register	Primary Purpose	Primary Relationships
OXL	Constitutional terminology	OCDR, OFR, OAR, ODR
OCDR	Dependency graph	OXL, OPR, OLR
OFR	Scientific findings	OXL, OAR
OPR	Primitive governance	OCDR, OLR

OLR	Laws and theorems	OCDR, OFR
ODR	Mandatory distinctions	OXL
OUQ	Open questions	OFR, OAR
OAR	Amendments	All registers

19. Register Change Control

A register update shall record:

- date;
- authorizing authority;
- affected records;
- rationale;
- amendment reference (if applicable).

No update shall occur without traceability.

20. Register Retirement

Registers are retired only when:

- constitutionally replaced;
- merged through formal determination.

Retired registers:

- retain identifiers;
- remain readable;
- remain citable.

Retirement is never deletion.

21. Minimum Required Register Set

Every constitutionally complete OriginOS corpus shall include, at minimum:

1. OXL — Lexicon Register
2. OCDR — Constitutional Dependency Register
3. OFR — Finding Register
4. OAR — Amendment Register
5. OUQ — Unresolved Questions Register

Additional registers may be introduced as scientific complexity increases.

22. Future Register Admission

A new register may be admitted only if:

1. it records information not already governed elsewhere;
2. the information requires persistent constitutional maintenance;
3. the information cannot be adequately represented by an existing register;
4. its purpose is constitutionally distinct.

No redundant registers shall be created.

23. Constitutional Freeze Interaction

Registers are not frozen when a Sprint freezes.

Instead:

- Sprint manuscripts become immutable;
- registers continue evolving;
- historical references remain preserved;
- amendments update registers rather than manuscripts.

This separation preserves both historical fidelity and current constitutional understanding.

24. Constitutional Determination

The OriginOS Constitutional Registers constitute the permanent constitutional memory of the OriginOS Discovery Programme.

They exist to preserve:

- terminology;
- findings;
- dependencies;
- amendments;
- unresolved questions;
- scientific evolution.

They shall operate as synchronized, cross-referenced, living constitutional records while preserving the immutability of frozen Sprint manuscripts.

No constitutional publication shall rely solely on manuscript text where the governing register records a later constitutionally authorized determination.

Relationship to the Governance Suite

With RG-012, the governance architecture becomes layered:

Governance Standards (RG)

- **RG-001** – Research Governance (*historical/superseded where applicable*)
- **RG-002** – Artifact Classification
- **RG-003** – Constitutional Amendment Governance
- **RG-004** – Evidence Register Governance
- **RG-005** – Dependency Recovery Governance
- **RG-006** – Primitive Admission Governance
- **RG-007** – Scientific Question Formulation
- **RG-008** – Research Lifecycle Governance
- **RG-009** – Constitutional Dependency Register Governance
- **RG-010** – OriginOS Lexicon Register Governance
- **RG-011** – Constitutional Freeze Standard
- **RG-012** – Constitutional Registers Standard

Living Constitutional Registers

Governed by RG-012:

- **OXL** – Lexicon Register
- **OCDR** – Constitutional Dependency Register

- **OFR** – Finding Register
- **OAR** – Amendment Register
- **OUQ** – Unresolved Questions Register
- **OPR** – Primitive Register (*future*)
- **OLR** – Law Register (*future*)
- **ODR** – Distinction Register (*future*)

This establishes a clear separation between **governance policy** (RG documents) and **operational constitutional records** (OriginOS Registers), giving the programme a scalable governance architecture suitable for long-term scientific evolution.
